

## CF Shield – HOW TO USE

**CFShield<sup>x</sup>**  
release agent

CF Shield is a highly effective, easy to use release agent which is non-flammable, biodegradable, non-staining to concrete, and prevents slurry adhering to porous surfaces.

CF Shield promotes clean and easy formwork removal, as well as longer form life. It does not contain petroleum or diesel fuel oil and is pleasant to use and handle. Spray on to almost any surface before generation of slurry or grime from concrete sawing, drilling or general building activities, for instant removal after job completion.

### HOW TO USE – Concrete Sawing & Drilling

1. Clean concrete wall and mark out cutting or drilling area.

2. Spray CF Shield onto concrete surface with pressure pack or similar – mix 10% with water and apply. Let dry for 10-15 mins - hard concrete surfaces might require up to 2 coats, porous concrete or masonry might require 3-4 coats. Approx coverage is 7-10m<sup>2</sup> per mixed litre. Higher concentrations can be used where applicable or as required.
